Know how your clients trade. Act before it costs you.

MT4 · MT5 · LIVE SYNC · CLIENT ANALYTICS · RISK INSIGHT · CLEAR REPORTS

Deep Trade Analytics turns every trade on your platform into plain numbers that anyone in the room can read — from the dealing desk to the board.

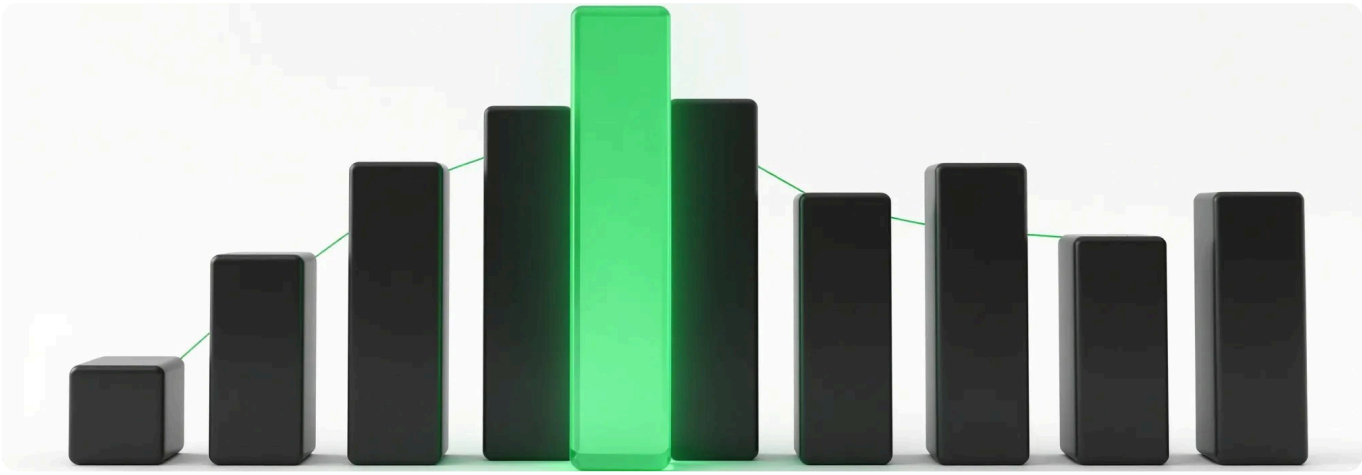

FOR FX BROKERS AND THEIR LEADERSHIP

See which clients win, which lose, where your risk sits and why traders leave — in one place, updated every few minutes, without a data team.

Every trade in. Clear answers out.

Your clients already leave a full record of their trading in MetaTrader. Deep Trade Analytics collects it, checks it and turns it into a small set of numbers with one meaning each — so nobody has to build spreadsheets to know what happened.

Net profit and loss

What was really made or lost after commission and swap, per day, month and year.

Win rate

How often a client's trades end in profit — and how many of their days do.

Profit factor

Money won for every unit lost. Above 1 the client is winning; below 1, losing.

Drawdown

The deepest fall from a high point. A quick sign of how much risk a client runs.

Calendar view

Every trading day coloured green or red, so good and bad weeks show at a glance.

Long vs short

Which direction pays for the client — buying or selling — and by how much.

Holding time

Scalper or swing trader? Average time in a trade tells you in one number.

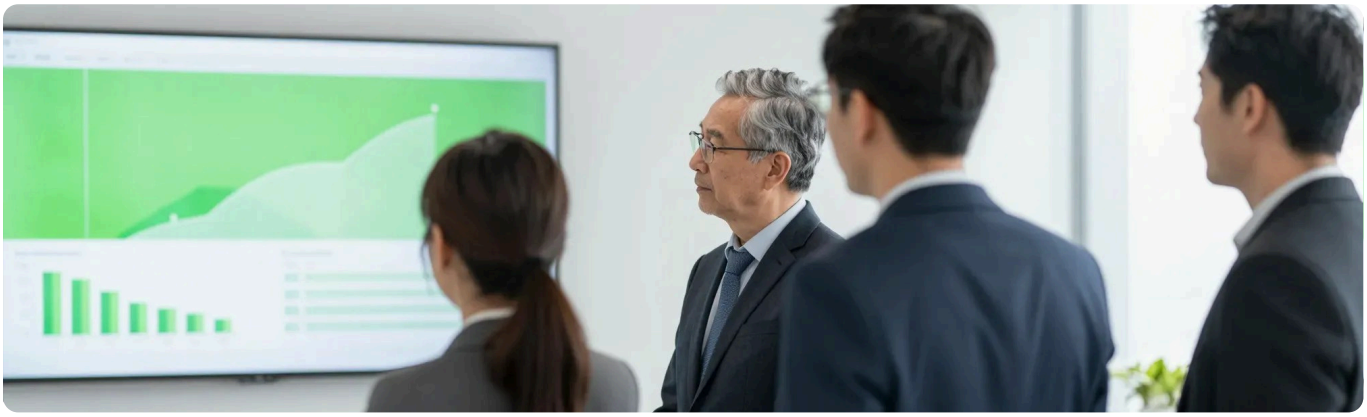

Streaks and records

Best and worst trade, longest winning and losing runs — the moments that change behaviour.

One definition per number: every screen, report and export uses the same calculation, so the dealing desk, finance and the board always see the same figure.

Every seat at the table gets its answer.

The same trade data answers different questions for each executive. Each one opens the view they need — no request to IT, no waiting for a monthly report. Views across all your clients arrive with the broker workspace (see the roadmap on page 05).

CEO

Is the client base healthy?

Profitable and losing clients side by side, how activity is trending, and early signs that good traders are slowing down or leaving.

CFO

Where does the revenue come from?

Commission, swap and client results per period and per group, calculated the same way every time, ready for the monthly numbers.

CRO AND DEALING

Which flow needs attention?

Consistently profitable clients, deep drawdowns and unusual trading styles stand out instead of hiding in thousands of rows.

CMO AND RETENTION

What keeps traders trading?

Clients who can see their own statistics understand their results and stay longer. Give them the trader view as a value-added service.

THREE QUESTIONS ANSWERED EVERY MORNING

Who is winning?

The clients whose results stand out, good or bad, with the numbers behind it.

What changed?

Yesterday against the usual pattern: volume, results and trading style.

What is at risk?

Drawdowns, losing streaks and quiet accounts that signal a client may leave.

Works with the platforms your clients already use.

No new trading platform and no change for your clients. Deep Trade Analytics reads the trading history that MetaTrader already keeps and stays up to date on its own.

LIVE LINK TO MT4 AND MT5

Connected with the read-only investor password. History arrives in full, then new trades every five minutes.

STATEMENT UPLOAD

Drop in an MT4 or MT5 account statement and the analytics are ready within a minute. Uploading the same file twice never doubles a trade.

DILIGIO FINTECH SUITE ROADMAP

Brokers on the FinTech Suite back office get a direct trade feed, with no extra setup for clients.

READ-ONLY BY DESIGN

The investor password can view trades but never place one. It is used once to connect and is never stored, queued or written to a log.

Disconnecting stops the link immediately and keeps the history already collected.

THREE STEPS FROM DATA TO DECISION

1 · Connect. Link an account live or upload a statement.

2 · Calculate. Trades are checked, combined into positions and summed per day.

3 · Act. Dashboards, calendar and reports show the result in plain numbers.

Each MetaTrader position becomes one trade, partial closes included, and every day is counted in your own time zone — not the broker server's.

Numbers you can defend.

An analytics tool is only useful if everyone trusts the figure on the screen. Deep Trade Analytics is built so the same question always gets the same answer.

Tested against worked examples

Every metric is checked against hand-calculated results before release.

Each account sees only its own data

Access is decided in one place, so no screen or report can show the wrong client.

Safe to repeat

Re-importing or re-syncing updates the same trades and never creates duplicates.

Data deleted on request

Closing an account disconnects every link and removes all of its data.

NOW

Trader analytics

Live MT4/MT5 link, statement upload, dashboards and reports.

NEXT

Broker workspace

All your clients in one view for the dealing desk and management.

LATER

Research and signals

Patterns drawn from the collected trade and market data.

NEXT STEP

See your own trading data in it.

Ask for a demo: connect one demo account or upload one statement and see the dashboards, calendar and reports built from it within a minute.
